CLOUD-FIRST VS. SELF-HOSTED: DEPLOYMENT STRATEGIES FOR FUTURE TECH PROFESSIONALS

PRESENTATION SKILLS FOR IT

To prepare for our seminar on "Cloud-First vs. Self-Hosted: Deployment Strategies for Future Tech Professionals",

Our group tarantech booked a room at the Learning Commons. During these practice sessions, we walked through the entire presentation together. Since my primary role was handling the technical support and managing the event brochures, I focused on observing and critiquing the presenters.

I paid close attention to how they delivered their assigned topics, giving constructive feedback on their tone, pacing, slide timing, and overall clarity. I wanted to make sure they explained core ideas effectively, such as comparing self-hosting to a project car and cloud hosting to a rented fleet vehicle.

During the actual seminar, I took charge of technical logistics and physical materials. I distributed the brochures to attendees, which provided an overview of our main discussion points, including shared security responsibilities, cost structures, and the 5-step decision guide.

Managing the technical side kept me actively involved in the overall flow of the event. I monitored the presentation screens, ensured smooth slide transitions, and supported the presenters from behind the scenes through the presentation and the Q&A portion. Participating in this role showed me how crucial thorough rehearsal, honest peer feedback, and reliable technical coordination are to delivering a coherent group seminar.
